Agenda

- Identifying the building blocks of CLX on Windows
 - How does a local cluster with a single Quorum work?
 - A new cluster model: How do Majority Node Sets work?
 - What is needed for a distributed environment?

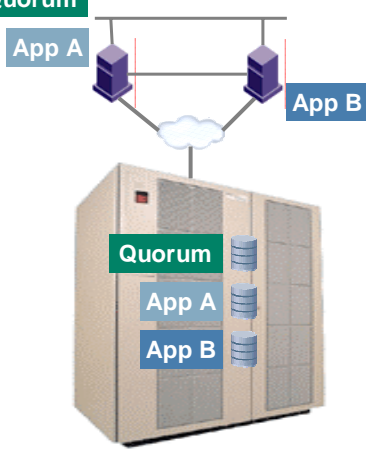

- Parameter Settings for CLX Resources

4/22/2004 2

Local Microsoft Cluster - using a single Quorum

Quorum

Shared disks are used

- to keep the application data

The Quorum disk is used

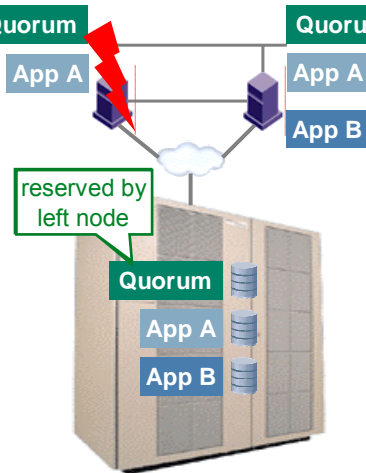

- to keep the Quorum-Log
- to keep a copy of the Cluster configuration
- to propagate Registry Checkpoints
- for arbitration, if LAN-connectivity is lost

4/22/2004 3

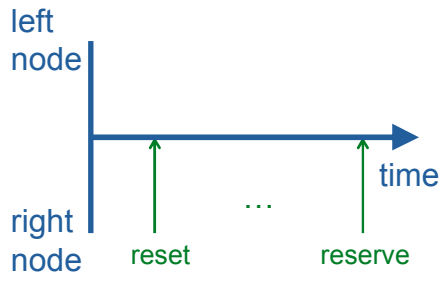

Local Microsoft Cluster - using a single Quorum

Quorum

Quorum Arbitration

4/22/2004 4

Local Microsoft Cluster - using a single Quorum

The diagram illustrates a Local Microsoft Cluster using a single quorum. On the left, a network of nodes (App A and App B) is shown with a red lightning bolt indicating a failure. A central cloud represents the quorum, which is labeled "reserved by left node". Below this, a server rack contains the quorum and applications App A and App B. To the right, a "Quorum Arbitration" timeline shows the interaction between a "left node" and a "right node". The left node sends "reserve" messages (green arrows) to the quorum. The right node sends a "reset" message (green arrow) and a "reserve fails" message (red arrow) to the quorum. The HP logo and "invent" tag are in the top right corner.

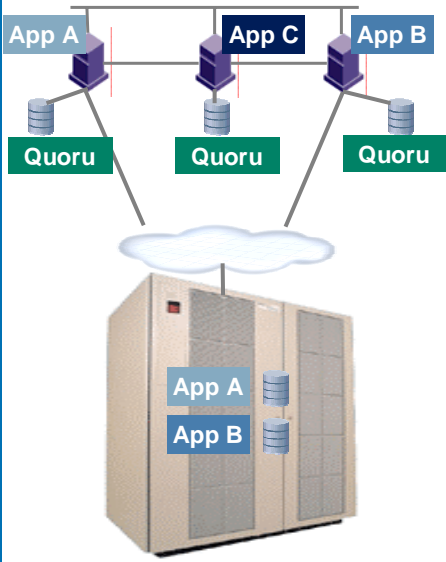

4/22/2004 5

Cluster Extension on Windows - using a distributed quorum

The diagram illustrates Cluster Extension on Windows using a distributed quorum. It shows two server racks. The left rack contains a quorum with three controllers (CTRL1, CTRL2, CTRL3) and application App A. The right rack contains a quorum with three controllers (CTRL1, CTRL2, CTRL3) and application App B. Green arrows indicate data replication between the quorum controllers of both racks. Above the racks, a network diagram shows App A and App B connected to a central quorum cloud. The HP logo and "invent" tag are in the top right corner.

4/22/2004 6

Microsoft Cluster with Majority Node Sets

Shared disks can be used

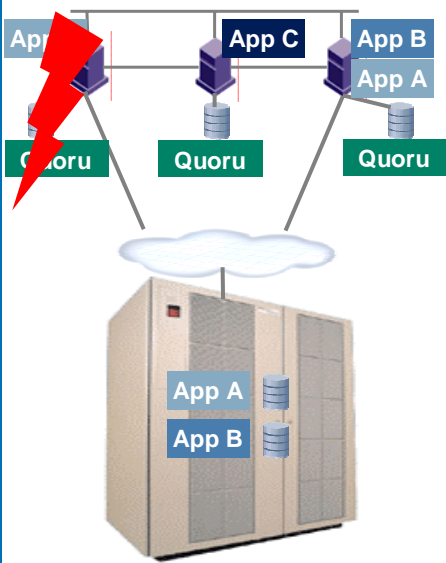

- to keep the application data, but they might not be necessary for all applications

The Quorum disks are

- used to keep a copy of the Cluster configuration
- synchronized by the Cluster Service

4/22/2004 7

Microsoft Cluster with Majority Node Sets

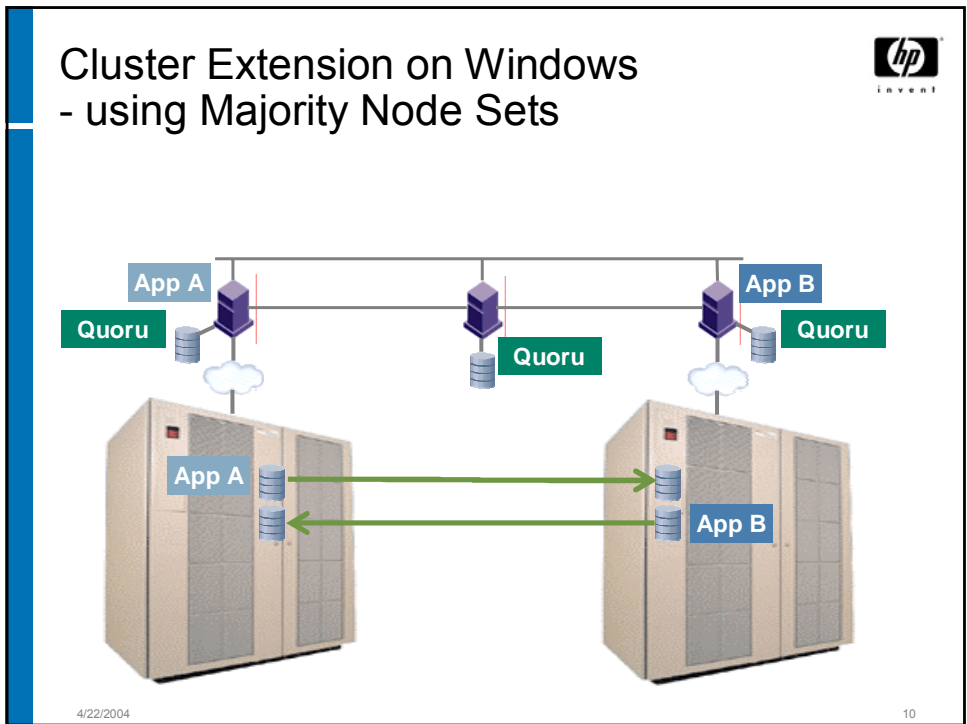

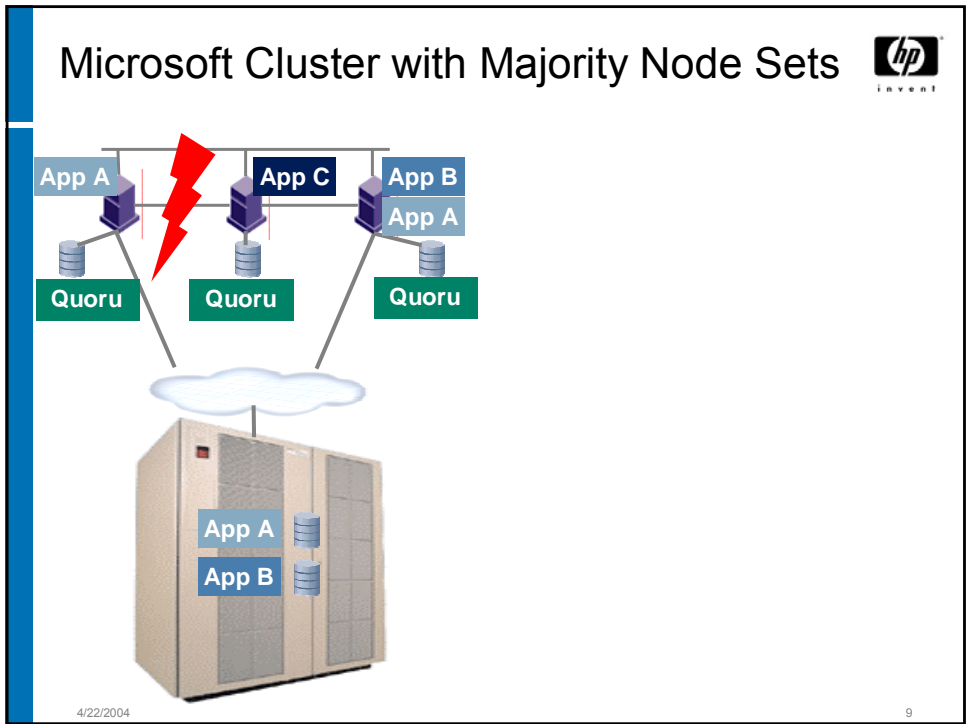

In case of a failure, the cluster will survive, if more than 50% of the nodes are still available

In case of a split site situation, the site with more than 50% of the nodes will survive

- No common quorum log and no common cluster configuration available => changes in the cluster configuration are only allowed, when all nodes are online AND LAN-connectivity is available for all surviving nodes!

Microsoft suggests to use this model for geographically dispersed clusters

4/22/2004

Agenda

- Integration of CLX into MSCS
 - Using a Distributed Quorum and External Arbitration
 - Using Majority Node Sets with CLX
 - Handling Shared Disks: CLX Resource Type, Cluster Administrator Extension, Resource Dependencies, ...

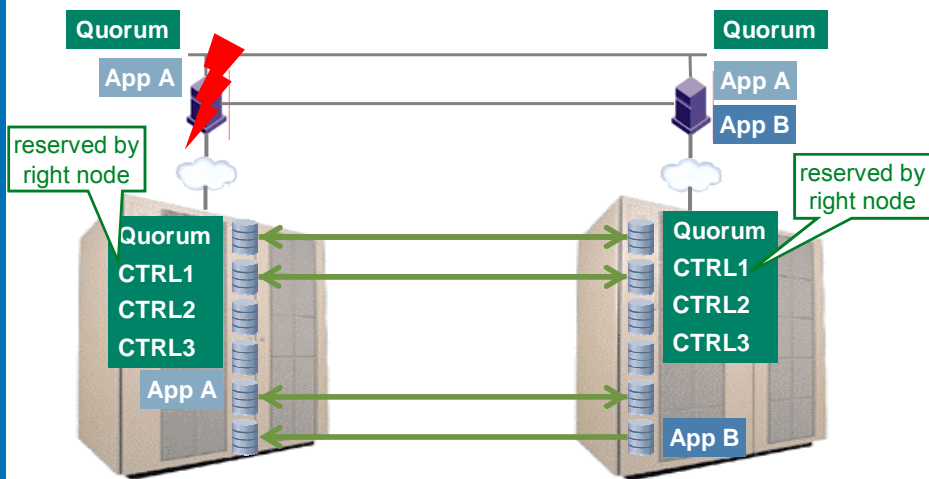

4/22/2004

Parameter Settings for CLX Resources

11

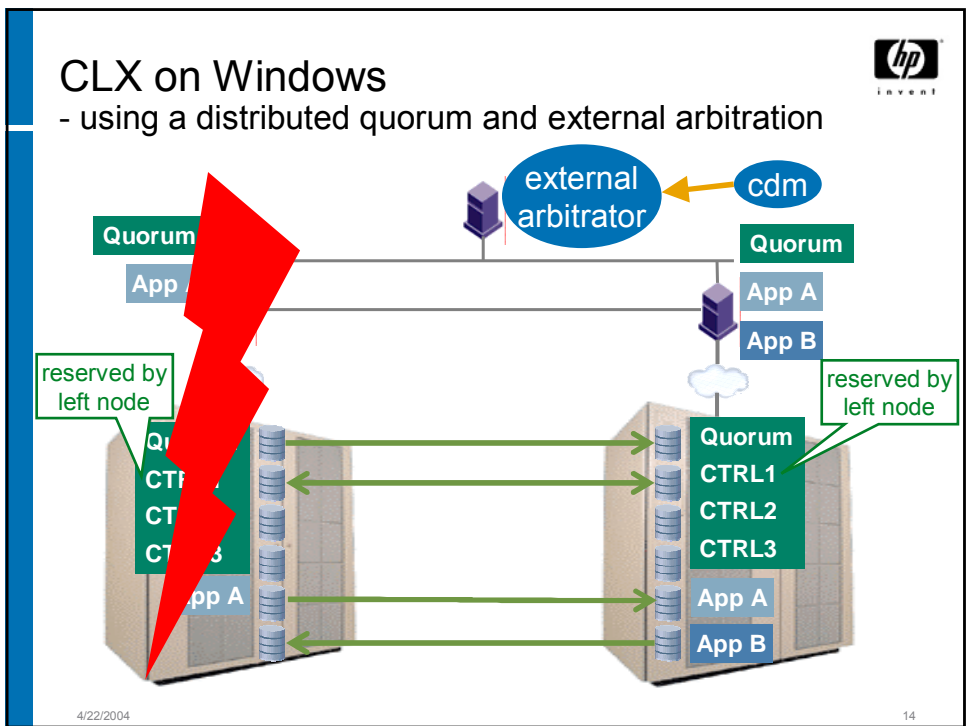

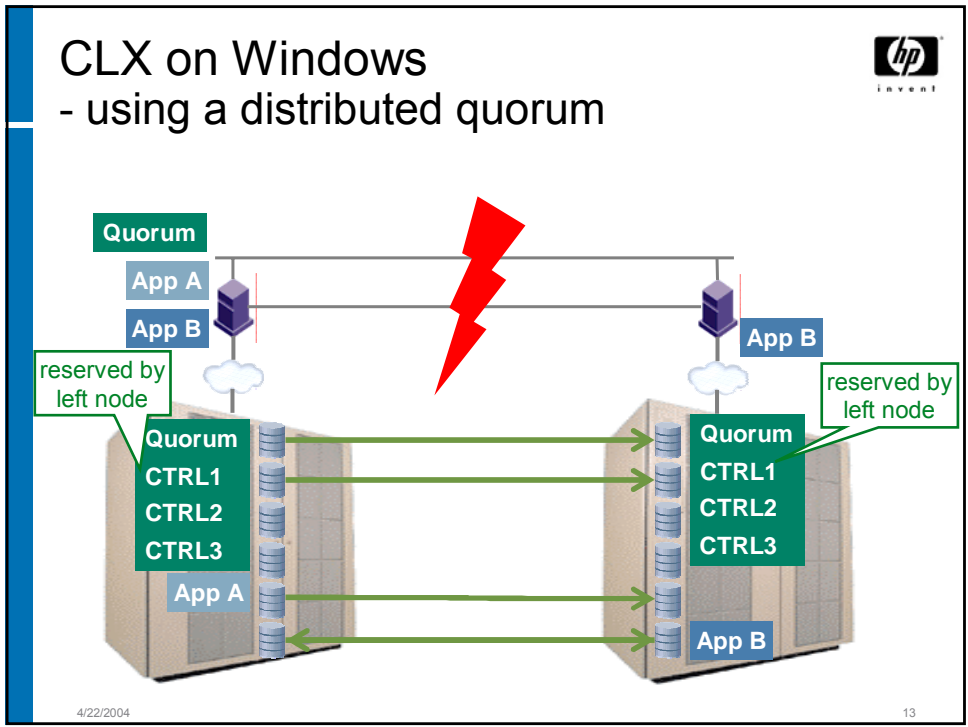

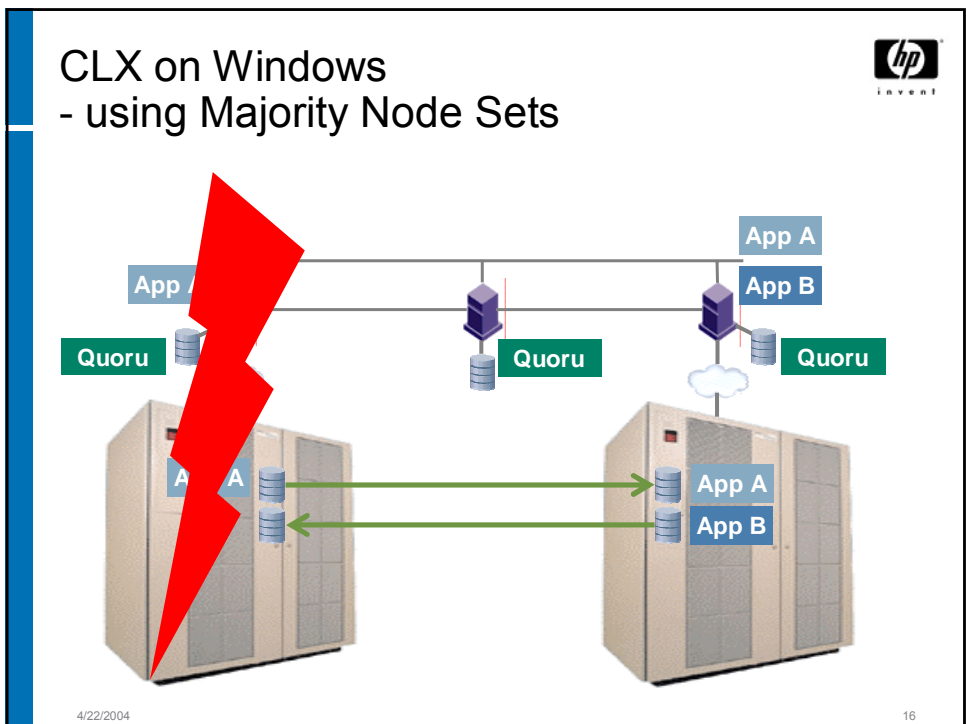

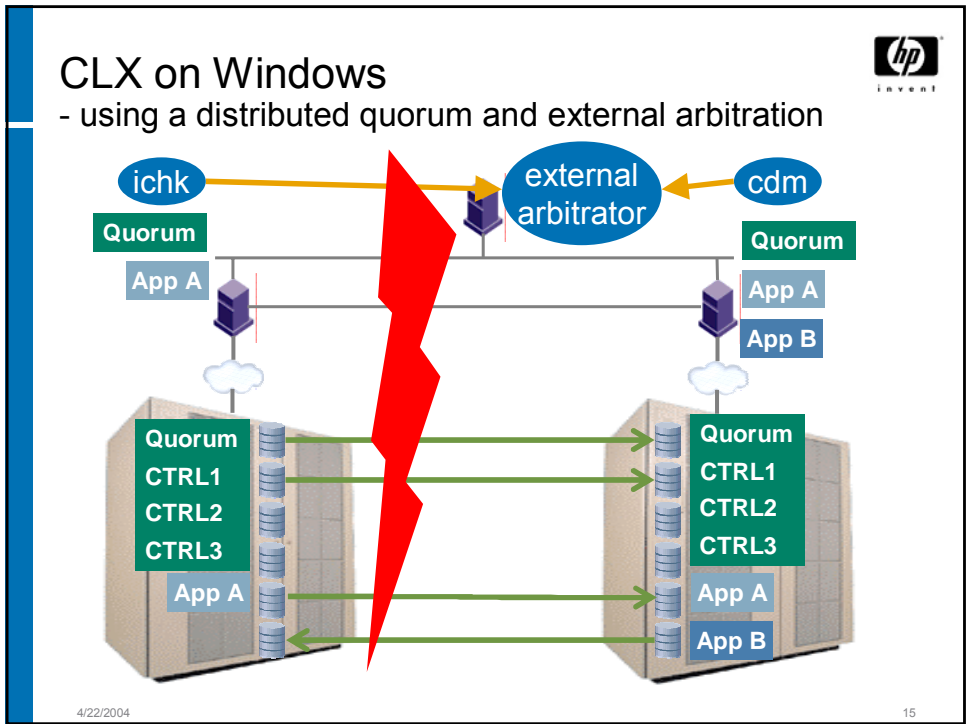

CLX on Windows - using a distributed quorum

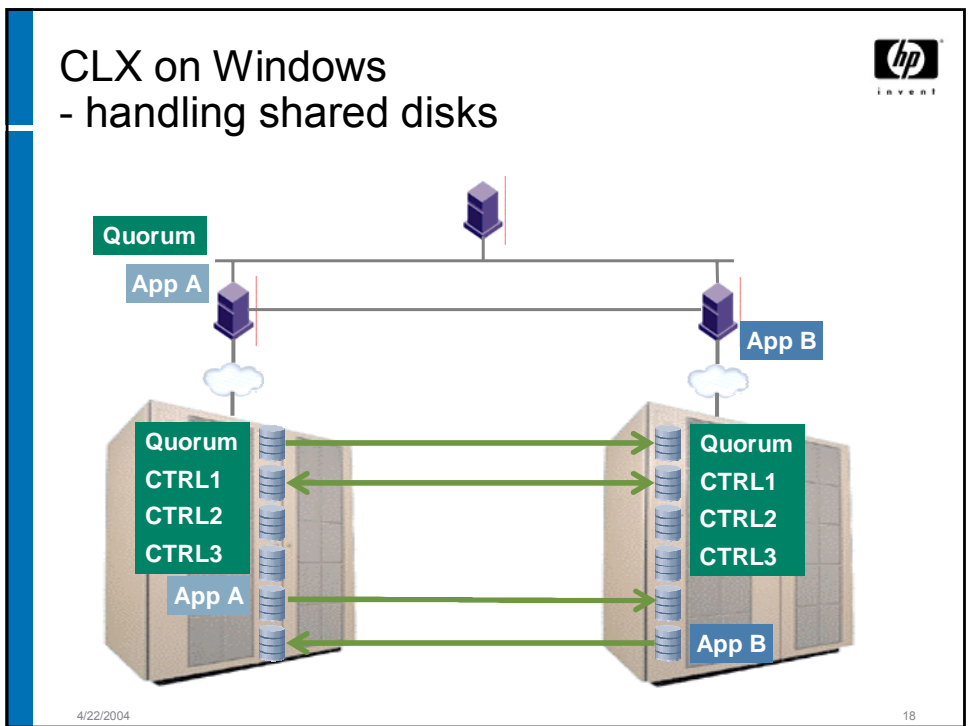

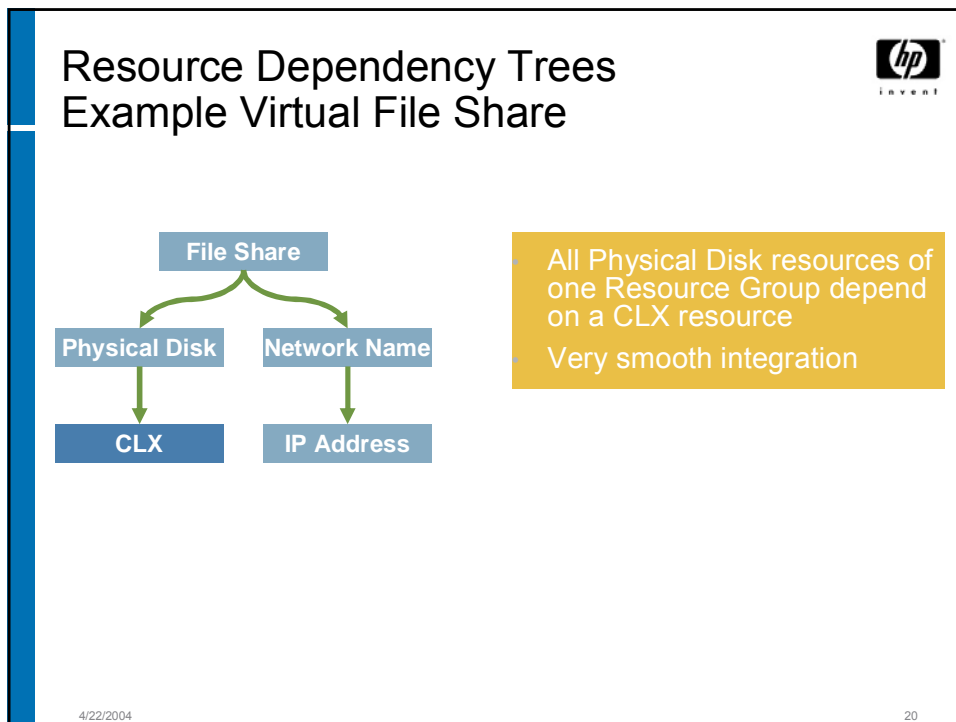

4/22/2004

12

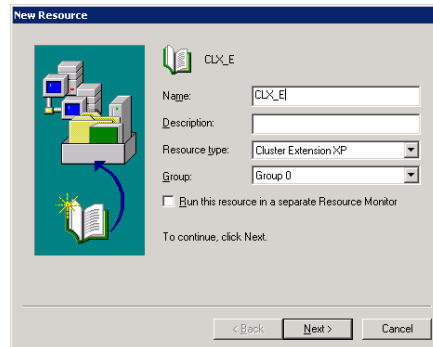

Resource Type „Cluster Extension XP“

What does it do?

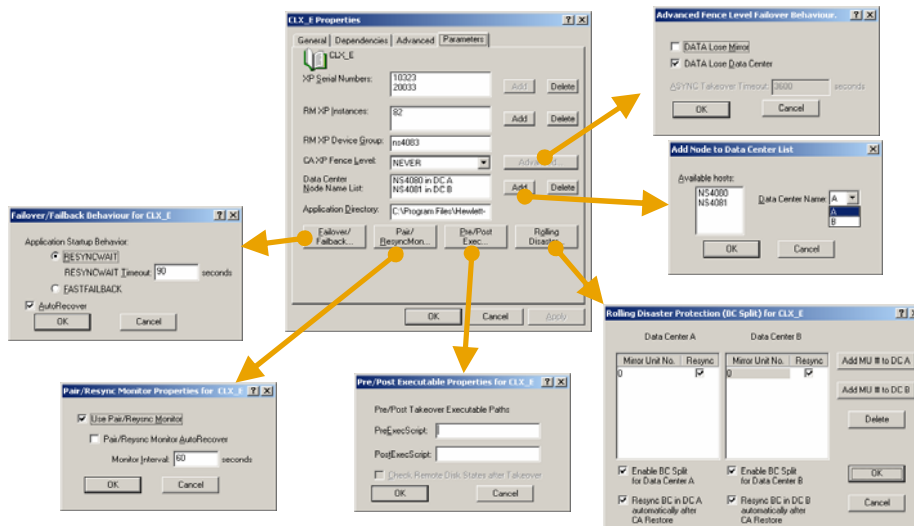

- responsible for takeover actions
- triggers the Pair-/Resync-Monitor, if configured
- double-checks fence-level, XP serial number, etc.
- uses RaidManager instance

4/22/2004

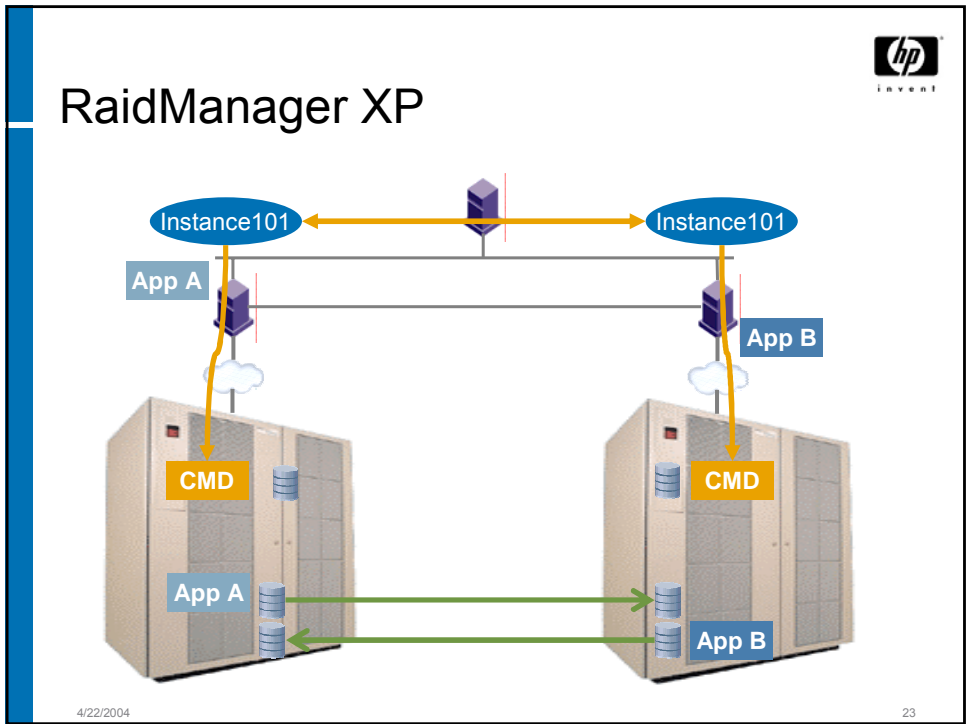

21

Cluster Administrator Extension DLL for the CLX Resource Type

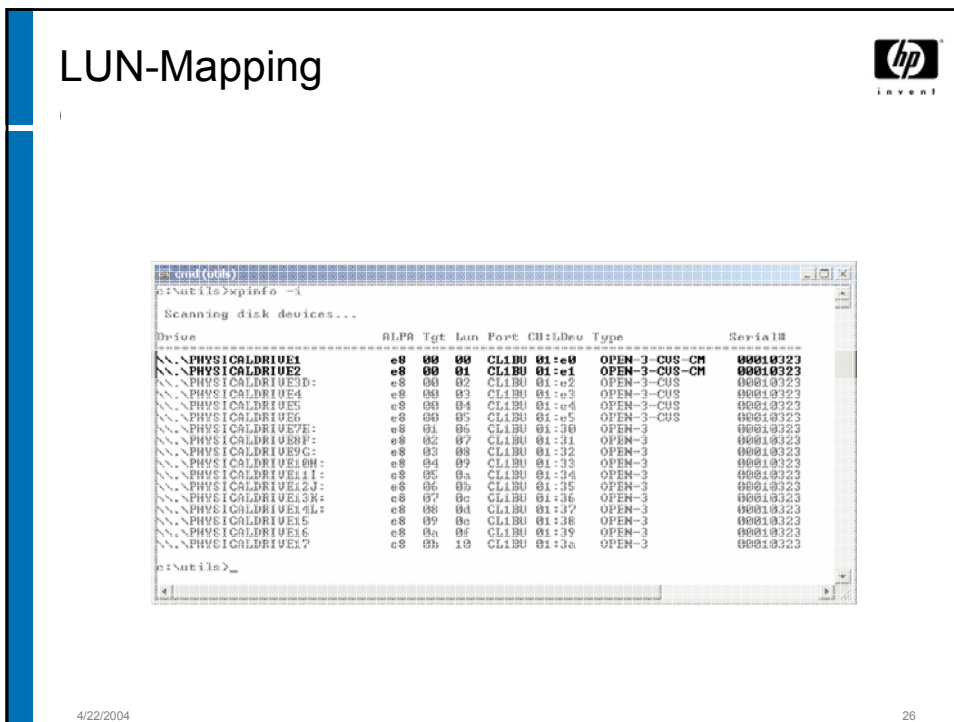

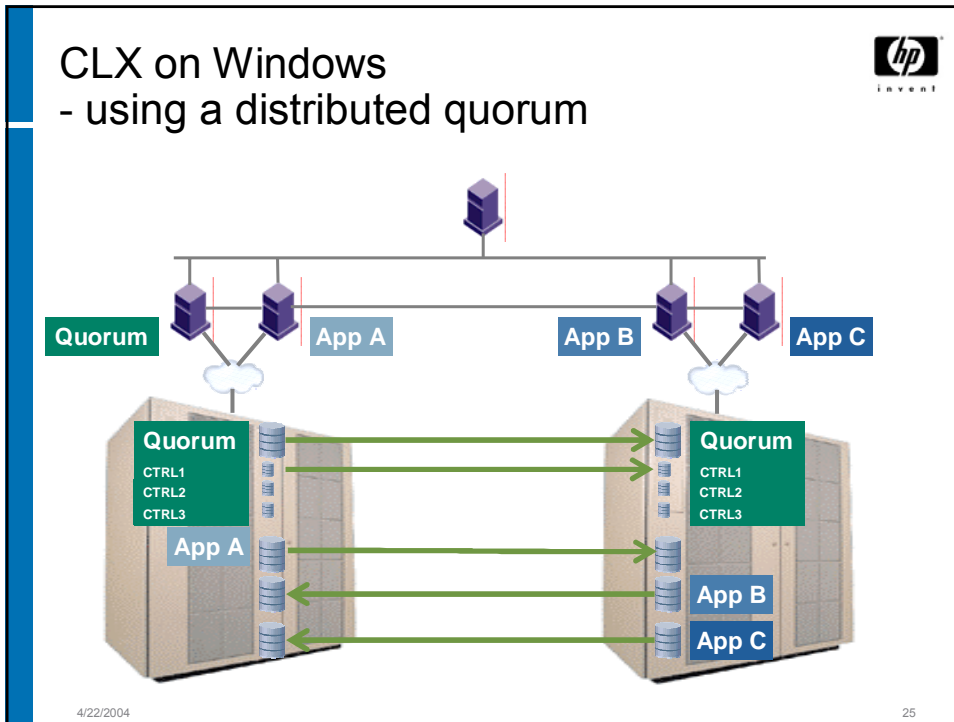

4/22/2004

22

-
- The slide is titled 'Agenda' and features the HP logo and 'invent' tagline in the top right corner. Below the title, the text 'raidmanager' is written in a smaller font. A bulleted list follows:
- Best practices
 - Choose a Cluster Model:
Distributed Quorum or Majority Node Sets?
 - LUN-Mapping
 - Parameter Settings for CLX Resources
- The date '4/22/2004' is in the bottom left, and the number '24' is in the bottom right.

LUN-Mapping Quorum and CTRL-Disks

Parameter Settings for CLX-Resources

- Fence level
 - for higher availability: **never**
 - for guaranteed data currency and consistency: **data**
 - To avoid latency over long distances: **async**
- Failover-/Failback-Behavior
 - Two nodes: **resyncwait**
 - more nodes: **fastfailback**
- Use **Autorecover** with care
- Timeout dependencies: **failover period** (group), **pending timeout** (clx resource), **RaidManager timeout** (horcmX.conf)
